MEMBER GUIDE

How the ClubAffili ecosystem works

The staking pool, the staking and product binaries, why rewards are paid in Club Token bought from the market, the 5% trading tax, and what is coming next. Written for everyone, technical or not.

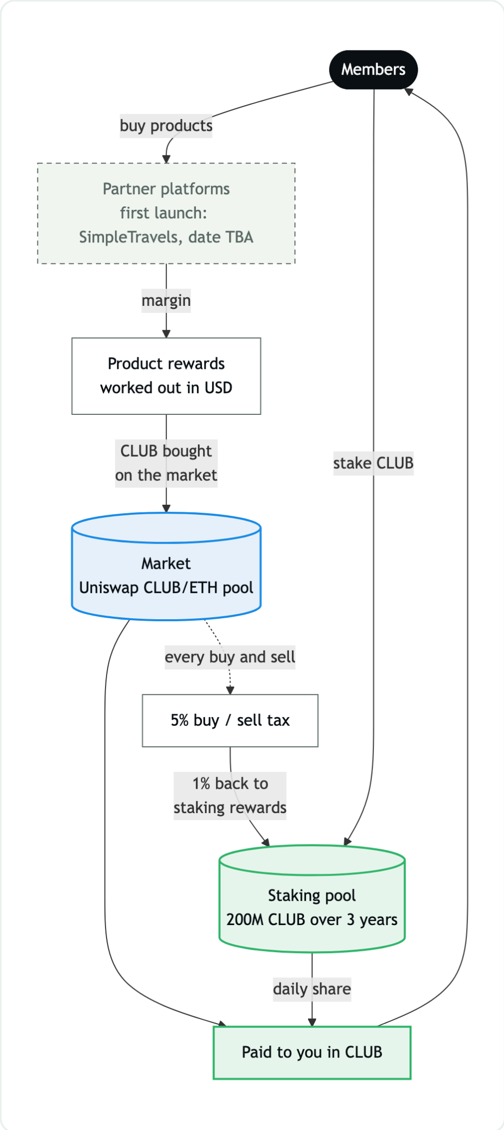
Contents

> **Before you read.** Club Token can go down in value as well as up. Nothing here is a recommendation to buy, sell, stake or hold Club Token, and plans described as "planned" have no date and may change. Always check the Staking page in your dashboard for the rules in force, and help.clubaffili.com for the latest version of this guide.

1. The ClubAffili ecosystem at a glance

How members, partners, Club Token, the staking pool and the 5% trading tax fit together, in one picture.

Quick answer: every ClubAffili reward is paid in Club Token (CLUB). Two things feed those rewards. The **staking pool** is a fixed allocation of CLUB shared out every day, topped up by 1% of every trade. **Partner purchases** are worked out in dollars and paid in CLUB that ClubAffili buys on the market. Your binary tree turns activity in your network into weekly rewards from both.



The parts, in plain words

Part	What it is	Status
Club Token (CLUB)	ClubAffili's own token on Ethereum. Fixed supply of 1,000,000,000.	Live
Staking pool	200,000,000 CLUB (20% of supply), shared out every day among everyone who stakes, over three years.	Live
Staking binary	A weekly reward on the CLUB staked in your two legs, paid in CLUB.	Live
5% buy / sell tax	Charged when CLUB is bought or sold on the market. 1% of each trade goes back to staking rewards.	Live
Product binary	A weekly reward on partner purchases in your two legs. Worked out in dollars, paid in CLUB.	Starts with the first partner launch (SimpleTravels, date TBA)
Liquidity-provider rewards pool	Rewards for members who provide CLUB/ETH liquidity.	Planned
Buybacks for stakers	CLUB bought back from the market with partner revenue.	Planned, once several partners are live

Why it is designed this way

Everything is paid in one currency, so every part points the same way. Product rewards are paid with CLUB bought on the market. Trading sends 1% back to stakers. Staking builds the staking binary for the people above you. Each part feeds the next instead of competing for the same budget.

In this collection

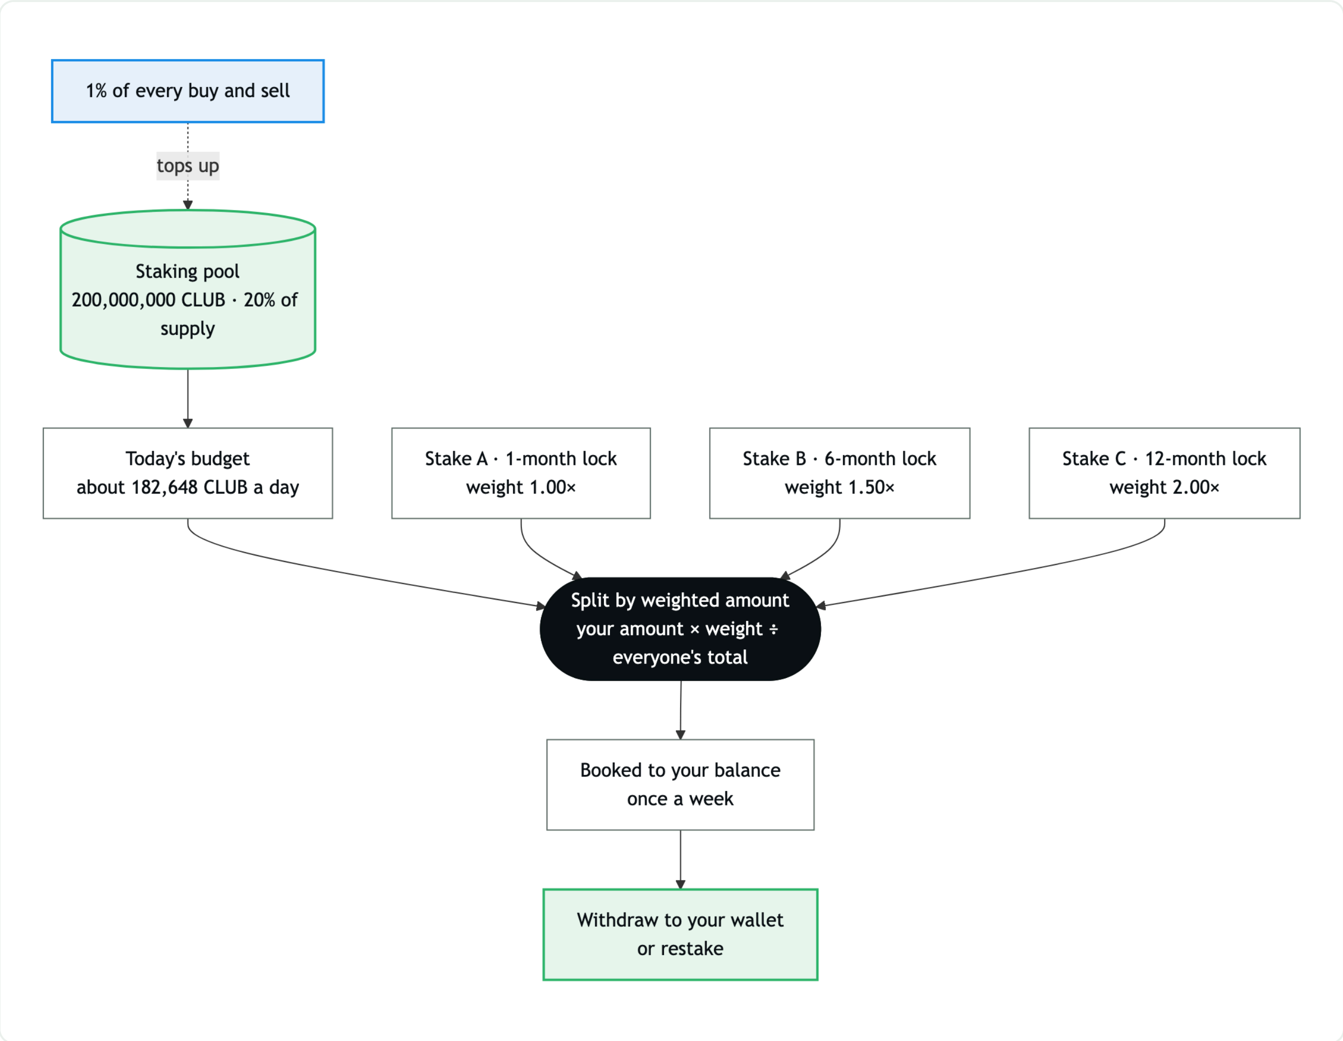
- **The staking pool: where staking rewards come from.** The daily split, lock weights and leaving early.
- **Staking binary and product binary.** Two binaries, one tree: how each works and how they differ.
- **Why product rewards are paid in Club Token bought from the market.** The $100 → $100 of CLUB example.
- **The 5% buy and sell tax.** What it is and where it goes.
- **What's coming next.** Liquidity rewards, the first partner launch and buybacks for stakers.

2. The staking pool: where staking rewards come from

A fixed pool of 200 million CLUB is shared out every day by weighted stake. How the daily split, lock weights, leaving early and the 1% trading top-up work.

Quick answer: 200,000,000 CLUB, 20% of the whole supply, is set aside for staking rewards and released over three years, about 182,648 CLUB a day. Every day that budget is shared across all active stakes by **weighted amount**: your CLUB × your lock term's weight. Longer locks weigh more. On top of that, 1% of every buy and sell of CLUB goes back to staking rewards.

How the daily split works



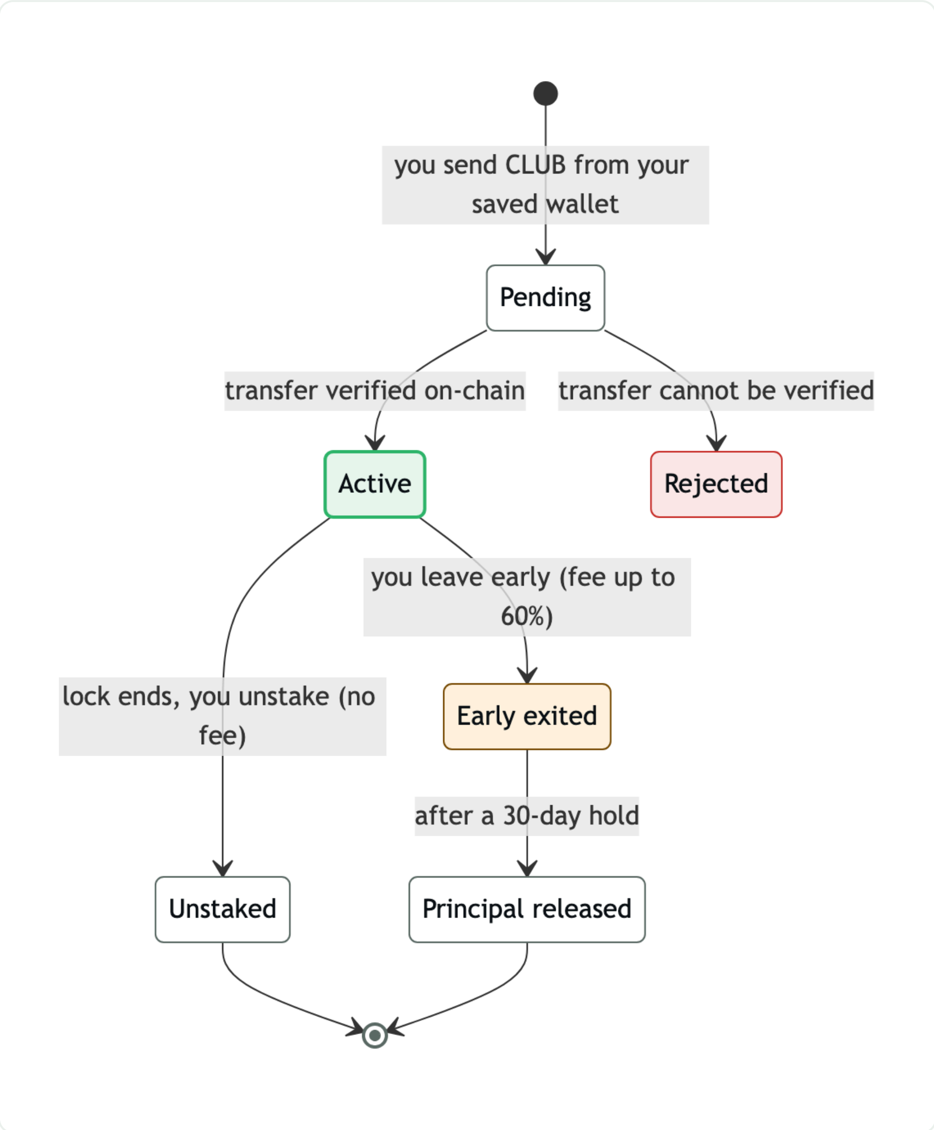
Example only. Say today's budget is 182,648 CLUB and everyone's weighted total is 20,000,000. A 10,000 CLUB stake on a 12-month lock has a weighted amount of 20,000 (10,000 × 2.0), so it receives 182,648 × 20,000 ÷ 20,000,000 ≈ 182.6 CLUB that day. When more CLUB is staked, the same budget is shared more thinly and each stake receives less. There is no fixed rate.

Lock terms and weights

Lock term	Weight	What it means
1 month	1.00×	The baseline share
3 months	1.25×	25% more share for the same amount
6 months	1.50×	50% more share
12 months	2.00×	Double share

The minimum is **$50 worth of CLUB in total**, at the live price, across your stakes. You can hold several stakes, each with its own amount and lock term.

The life of a stake



- **Pending → Active.** You send CLUB from your saved wallet; the stake starts earning once the transfer is verified on-chain.

- **Lock ends.** Unstake with no fee and your principal is released to your wallet.
- **Leaving early.** A 12-month stake pays a 60% fee on principal at any point before it matures. Shorter locks pay up to 60%, falling as the unlock date gets closer. The rest of your principal is held for 30 days, then released. Rewards you have already earned are kept.

The 1% top-up from trading

Every buy and sell of CLUB on the market carries a 5% tax. 1% of each trade goes back to staking rewards, so trading activity adds to what stakers share. See **The 5% buy and sell tax** in this collection.

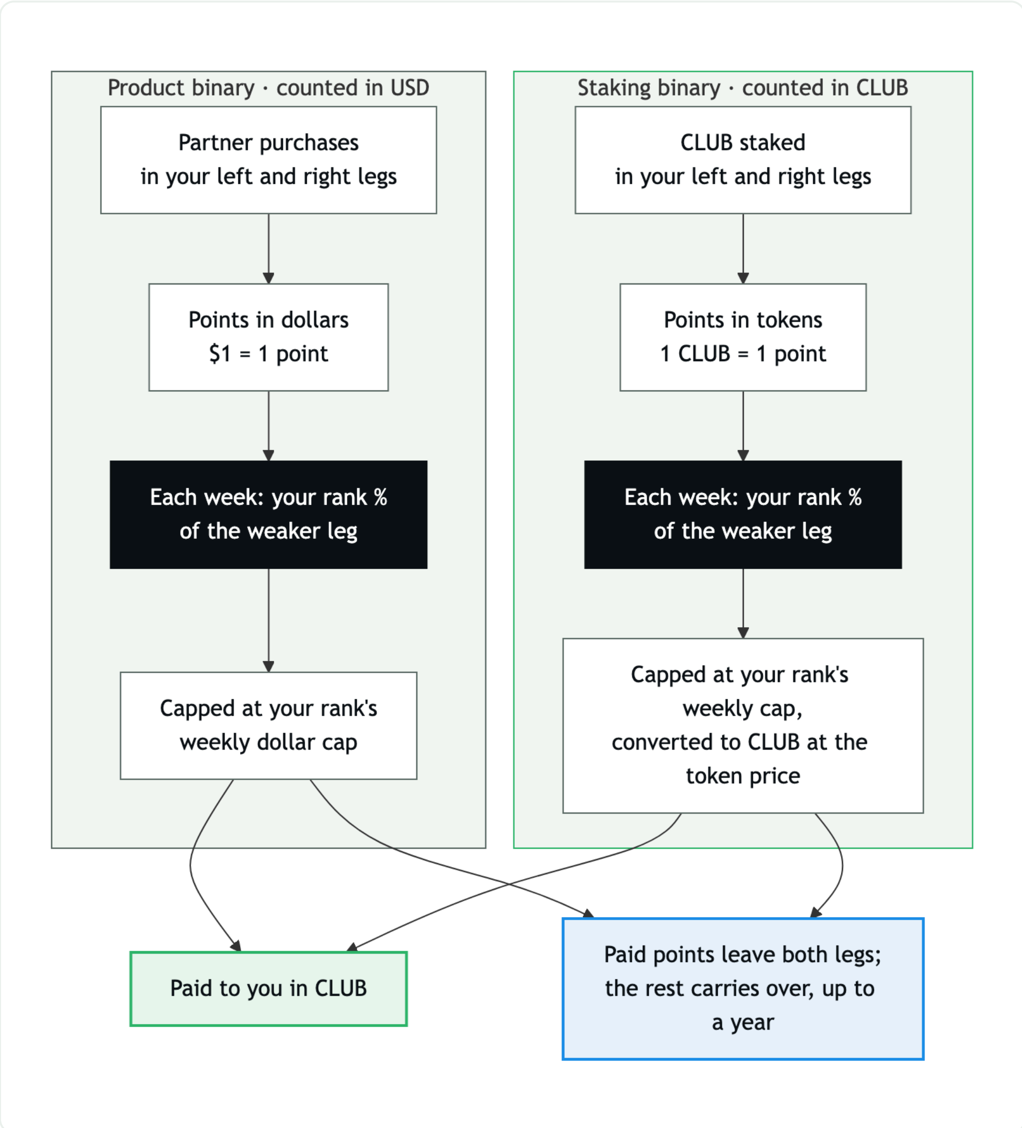
When the allocation runs out

The 200,000,000 CLUB allocation is finite and is scheduled over three years from when staking rewards started in September 2026. When it is used up, rewards from that allocation stop. What continues after that, such as the trading top-up and future buybacks, will be published here well before then.

3. Staking binary and product binary: two binaries, one tree

Your binary tree earns in two ways: staking binary counts CLUB staked in your legs, product binary counts partner purchases. How each works, how they differ and how they support each other.

Quick answer: you have one binary tree with a left and a right leg. It earns in two separate ways. **Staking binary** counts the CLUB staked in your legs, 1 point per token. **Product binary** counts partner purchases in your legs, 1 point per dollar. Both use the same weekly maths and both pay you in CLUB.



The same weekly maths

1. Points build up in your left and right legs.
2. Each week you earn your rank's percentage of the **weaker** leg.
3. The payout is capped at your rank's weekly cap.
4. The points behind what was paid leave **both** legs, so nothing is ever paid twice.
5. Unpaid points carry over, and expire after a year.

Side by side

	Staking binary	Product binary
What creates points	CLUB staked in your legs	Partner purchases in your legs
Unit	1 CLUB = 1 point	$1 = 1 point
You qualify with	A member you personally sponsored on each leg, with an active stake worth $50+	A member you personally sponsored on each leg, with $50+ of partner purchases
Weekly cap	Your rank's dollar cap, converted to CLUB at the token price	Your rank's dollar cap
Funded by	The binary allocation: 100,000,000 CLUB (10% of supply), paid until it runs out	The margin on partner purchases
Paid in	CLUB	CLUB, bought on the market
Status	Live	Starts with the first partner launch

An example week

Your left leg has 8,000 points and your right leg 5,000. At a 10% rate you earn 500: that is 500 CLUB for staking binary, or $500 paid in CLUB for product binary. Both legs drop by 5,000 and 3,000 points carry over on the left.

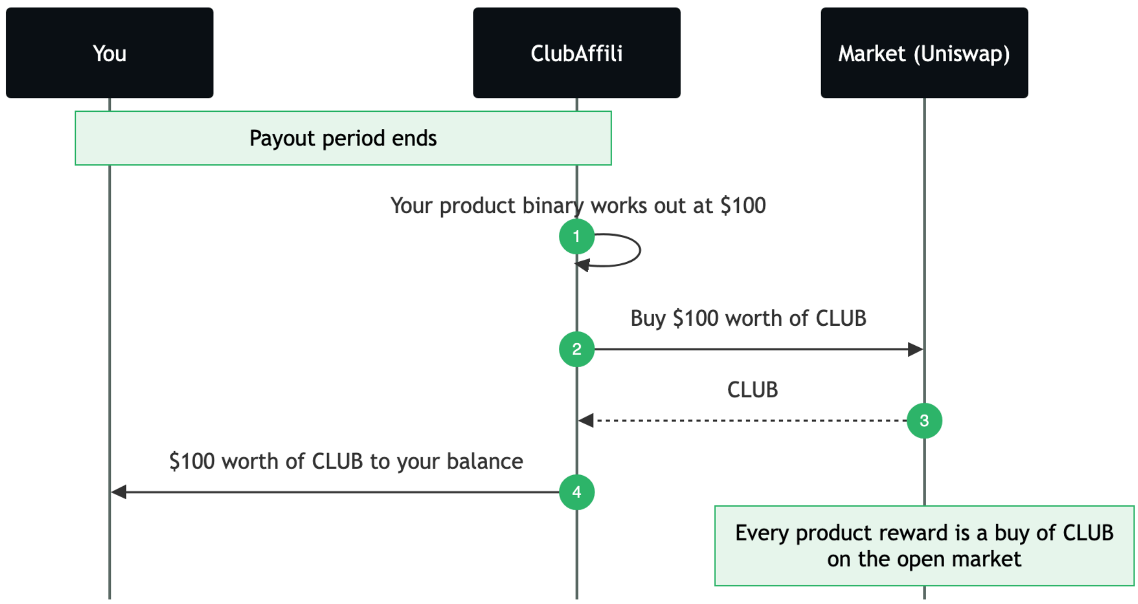
How the two support each other

Staking binary grows when members stake. Product binary grows when members buy from partners. Because product rewards are paid in CLUB, members who earn them can restake straight away, which adds to the staking binary of everyone above them. Rank percentages and caps are in **Rewards & Commissions**.

4. Why product rewards are paid in Club Token bought from the market

Product rewards are worked out in dollars and paid in CLUB that ClubAffili buys on the open market. What that means for you and for stakers.

Quick answer: if your product binary works out at **$100** for a payout period, you receive **$100 worth of CLUB**. ClubAffili buys that CLUB on the open market to pay you, rather than creating new tokens. So every product reward is also a purchase of Club Token.



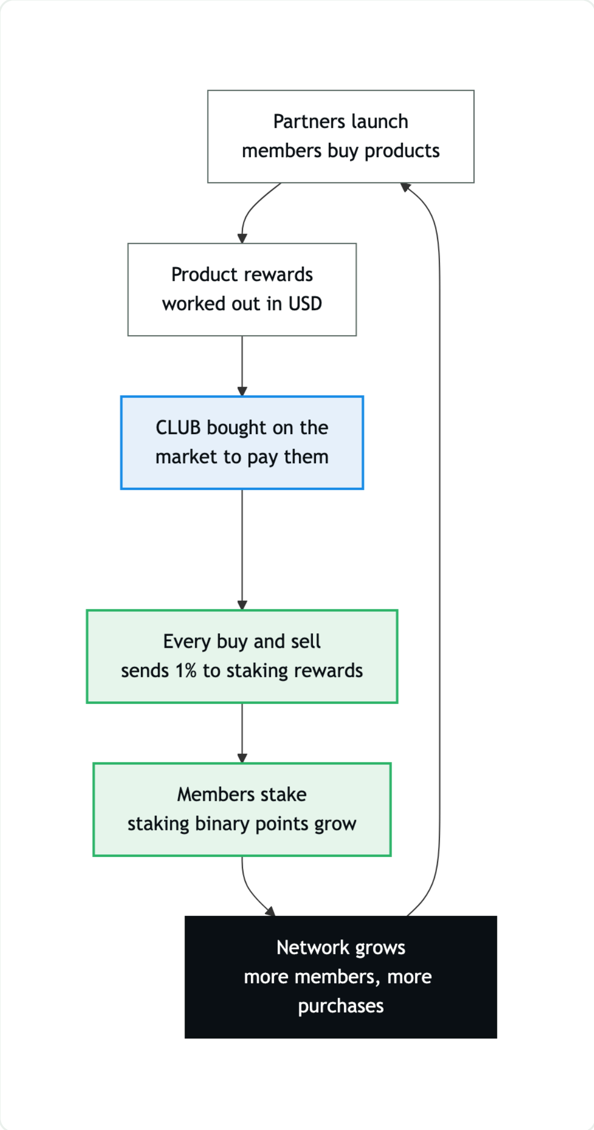
Step by step

1. Partner purchases in your legs are counted in dollars.
2. Each week your product binary is worked out in dollars and capped in dollars.
3. When the payout is processed, ClubAffili buys CLUB worth that dollar amount on the market.
4. The CLUB is credited to your balance. You can withdraw it to your wallet or restake it.

Why pay this way

- **One currency for every reward.** Staking rewards, staking binary and product binary all arrive as CLUB.
- **Real revenue, not new tokens.** Product rewards come from the margin on real partner purchases. The CLUB supply is fixed, so nothing is minted to pay you.
- **A reason to stake.** Rewards arrive in CLUB, so you can stake them straight away and add to your staking rewards and your upline's staking binary.

The cycle



Partner purchases create product rewards. Paying them means buying CLUB on the market. Trading sends 1% to staking rewards. Members stake, staking binary points grow, and the network grows, which brings more purchases. This cycle depends on real partner activity: **no partner platform is live yet**, so product rewards are not being paid today. They start with the first partner launch.

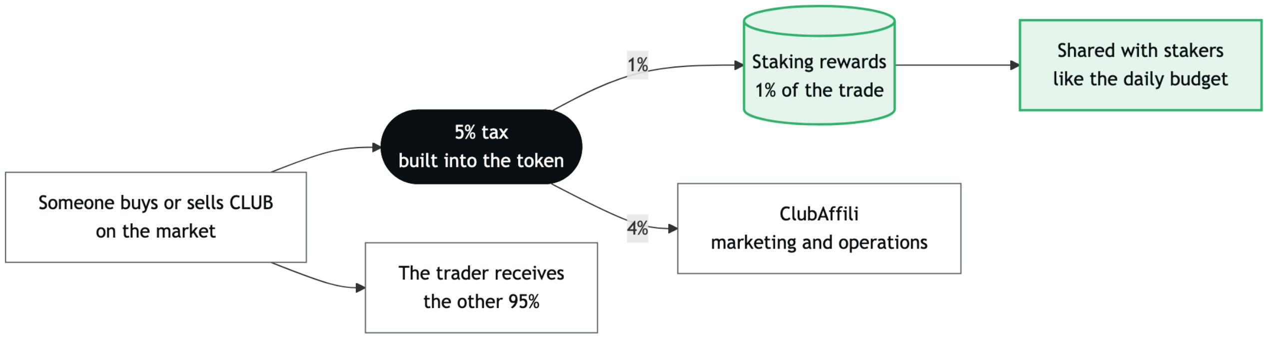
What the dollar amount means

The dollar amount of your reward is fixed when it is worked out. How much CLUB that buys depends on the market price when the payout is processed. After that, the CLUB you hold can go up or down in value like any other token.

5. The 5% buy and sell tax: what it is and where it goes

Every buy and sell of CLUB on the market carries a 5% tax built into the token. 1% of each trade goes back to staking rewards.

Quick answer: Club Token has a 5% tax on buys and a 5% tax on sells, built into the token contract. The main reason it exists is to feed staking rewards: **1% of every trade goes back to staking rewards**, so the people who trade in and out contribute to the people who stake.



What you will notice

- When you **buy** CLUB on the market, you receive about 95% of the tokens the swap would otherwise give you.
- When you **sell** CLUB, about 5% of the tokens you sell goes to the tax.
- Allow for the tax when you set slippage in your wallet. See **How to buy Club Token on Uniswap**.
- The tax is set in the token contract and ownership is renounced, so it can't be raised.

Where the 5% goes

Share of the trade	Where it goes
1%	Back to staking rewards, shared with stakers alongside the daily budget
4%	Held by ClubAffili for marketing and operations

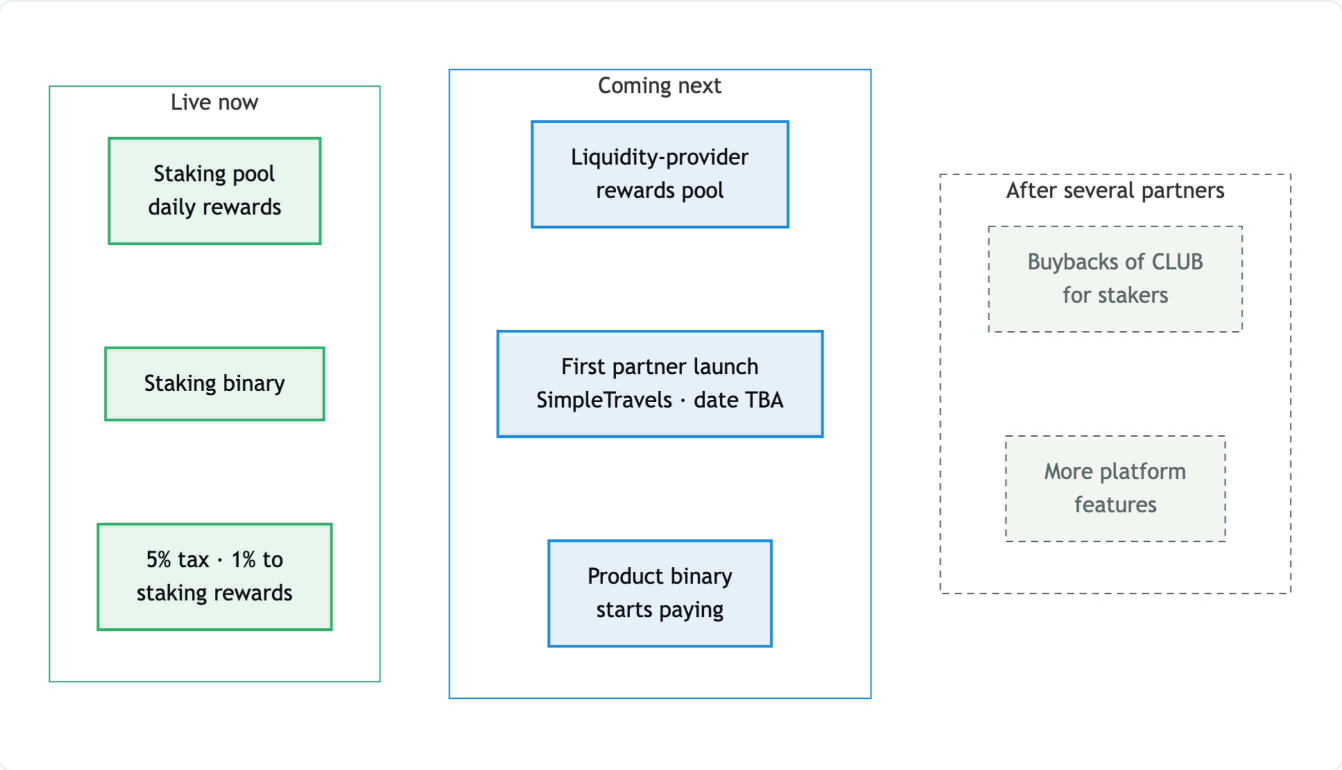
Why this matters for stakers

Staking rewards come from the fixed 200,000,000 CLUB allocation. The 1% trading share adds to that from real market activity, so the more CLUB is traded, the more flows back to the people who stake.

6. What's coming next: liquidity rewards and partner buybacks

Planned additions: a liquidity-provider rewards pool, the first partner launch, and CLUB buybacks for stakers once several partners are live. Planned, not promised.

Quick answer: three things are planned. A **rewards pool for liquidity providers**. The **first partner launch** (SimpleTravels, date to be announced), which starts product binary. And, once several partner platforms are live, **buybacks of CLUB for stakers** funded by partner revenue. None of these has a date yet.



A rewards pool for liquidity providers

Today you can provide CLUB/ETH liquidity on Uniswap: see **How liquidity pools work: fees and risks**. We plan to add a separate rewards pool for liquidity providers. How it is funded and shared will be published here before it opens. Until then, providing liquidity earns only the pool's own trading fees.

The first partner launch

SimpleTravels is launching first; the date is to be announced. Product binary starts paying once partner purchases begin.

Buybacks for stakers

Once several partner platforms are live, we plan to use part of the platform's revenue to buy CLUB back from the market for stakers, alongside more platform features. The details will be published here first.

Planned, not promised

These plans depend on partners launching and can change. Please do not buy or stake Club Token on the strength of anything on this page. We will announce each one in News when it is ready.

Important

This article explains how ClubAffili works today. It is general information, not financial, investment, legal or tax advice, and nothing in it is a promise of rewards, returns or a token price. Club Token can go down in value as well as up. Rules and figures can change: the latest version is always at help.clubaffili.com, and the Staking page in your dashboard shows the rules in force.

Club Token (CLUB) is an ERC-20 token on Ethereum mainnet. Always confirm the contract address on the Club Token page inside your dashboard, never from a link someone sends you. ClubAffili will never ask for your seed phrase or private key.
